Document Name: CIVE3331\_Exercises\_002.doc

Purpose: Exercises related to Lecture # 2. These exercises develop unit conversion skills and an understanding of the concept of concentrations in different environmental media (air and water). The last exercise requires the student to exercise critical thinking and make an assessment of the relative risk of two exposure pathways. Direct relationships to various accreditation objectives are highlighted in **Bold** type in the following sections. The exercises start on the next page.

Relevant ABET EC 2000 Criteria: Criterion 3 Program Outcomes and Assessment

- (3-a) an ability to **apply knowledge of mathematics, science, and engineering.**
- (3-e) an ability to identify, **formulate, and solve engineering problems.**
- (3-b) an ability to design and conduct experiments, as well as **to analyze and interpret data.**
- (3-k) **an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.**

Relevant CEE Educational Objectives:

- (3) Emphasize problem-identification, **problem-formulation** and communication skills, **problem-solving techniques and the many facets of engineering design** throughout the curriculum.
- (5) **Prepare every student to develop the skills for critical thinking and lifelong learning.**

Relevant CEE Program Outcomes:

- ii. **Students should acquire the ability to solve practical civil engineering problems by applying the knowledge of mathematics, science, engineering, modern techniques, skills and practical tools they gained in their courses.**

## CIVE 3331 Environmental Engineering

## Exercise\_002-1

The proposed air quality standard for ozone ( $O_3$ ) is 0.08 ppm. Express this standard in  $\mu g/m^3$  at 1 atm of pressure and  $25^\circ C$ .

Gas problem: ppm is vol/vol unit

$$\cancel{0.08} \quad 0.08 \cdot 10^{-6} \frac{m^3}{m^3} \times \frac{10^3 L}{m^3} \times \frac{1 \text{ mol}}{24.46 L} \times \frac{48 g O_3}{1 \text{ mol}} = 1.569 \cdot 10^{-4} \frac{g}{m^3}$$

$$1.569 \cdot 10^{-4} \frac{g}{m^3} \times \frac{10^6 \mu g}{1 g} = 156.9 \mu g/m^3$$

Report as  $157 \mu g/m^3$

## CIVE 3331 Environmental Engineering

## Exercise\_002-2

The proposed air quality standard for ozone ( $O_3$ ) is 0.08 ppm. At the elevation of Denver (about 1700 meters), the pressure is about 0.82 atm. Express the ozone standard at this pressure and at a temperature of  $15^\circ C$ .

Ideal gas

$$pV = nRT \quad T = 273.15, \quad P = 1 \text{ atm}, \quad n = 1 \text{ mol}, \quad V = 22.414$$

Boyle's Law

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$\frac{(1 \text{ atm})(22.414 \text{ L})}{273.15 \text{ K}} = \frac{(0.82 \text{ atm})(?? \text{ L})}{(273.15 + 15 \text{ K})} \quad \text{solve for } ??$$

$$V_{\text{denver}} = 28.835 \text{ L/mol}$$

Now repeat 002-1 using this volume

$$0.08 \cdot 10^{-6} \text{ m}^3/\text{m}^3 \times \frac{10^3 \text{ L}}{\text{m}^3} \times \frac{1 \text{ mol}}{28.835 \text{ L}} \times \frac{48 \text{ g } O_3}{\text{mol}} = 1.3317 \cdot 10^{-4} \text{ g}/\text{m}^3$$

$$1.3317 \cdot 10^{-4} \text{ g}/\text{m}^3 \times \frac{10^6 \mu\text{g}}{\text{g}} = 133.1 \mu\text{g}/\text{m}^3$$

report as  $133 \mu\text{g}/\text{m}^3$

## CIVE 3331 Environmental Engineering

## Exercise\_002-3

Suppose the exhaust gas from an automobile contains 1.0 % by volume of carbon monoxide (CO). Express this concentration in  $\text{mg}/\text{m}^3$  at  $25^\circ\text{C}$  and 1 atm.

$$[\text{CO}] = 0.01 \frac{\text{m}^3}{\text{m}^3} \times \frac{10^3 \text{L}}{\text{m}^3} \times \frac{1 \text{mol}}{24.46 \text{L}} \times \frac{28 \text{g CO}}{\text{mol}} = 11.447 \frac{\text{g CO}}{\text{m}^3}$$

$$11.447 \frac{\text{g CO}}{\text{m}^3} \times \frac{10^3 \text{mg}}{\text{g}} = 11,447 \frac{\text{mg}}{\text{m}^3} \text{ CO}$$

report as  $11,450 \frac{\text{mg}}{\text{m}^3} \text{ CO}$

## CIVE 3331 Environmental Engineering

## Exercise\_002-4

Suppose the average concentration of  $\text{SO}_2$  is measured to be  $400 \mu\text{g}/\text{m}^3$  at  $25^\circ\text{C}$  and 1 atm. Does this exceed the (24-hr) air quality standard of 0.14 ppm? (Table 2.1 of textbook, or a periodic table of elements contains the required atomic weights for this exercise)

$$\frac{400 \cdot 10^{-6} \text{ g SO}_2}{\text{m}^3} \times \frac{1 \text{ m}^3}{1000 \text{ L}} \times \frac{24.46 \text{ L}}{1 \text{ mol}} \times \frac{1 \text{ mol}}{64 \text{ g SO}_2} = 1.53 \cdot 10^{-7} \frac{\text{m}^3}{\text{m}^3}$$

$$1.53 \cdot 10^{-7} \frac{\text{m}^3}{\text{m}^3} \times 10^6 = 0.152 \text{ ppm}$$

report as 0.15 ppm which does  
exceed 0.14 ppm

## CIVE 3331 Environmental Engineering

## Exercise\_002-5

A typical motorcycle emits about 20 g of CO per mile. What volume of CO would a 5-mile trip produce after the gas cools to 25°C at 1 atm?

$$V = \frac{20 \text{ g CO}}{\text{mile}} \times 5 \text{ miles} \times \frac{1 \text{ mol CO}}{28 \text{ g CO}} \times \frac{24.465 \text{ L}}{\text{mol}} \times \frac{1 \text{ m}^3}{10^3 \text{ L}} = 0.087 \text{ m}^3$$

report as 0.09 m<sup>3</sup>

## CIVE 3331 Environmental Engineering

## Exercise\_002-6

A typical motorcycle emits about 20 g of CO per mile. What volume of air per meter of distance traveled could be polluted to the air quality standard of 9 ppm (after the gas has cooled to 25°C at 1 atm)?

$$9 \text{ ppm CO} : \frac{9 \text{ m}^3 \text{ CO}}{10^6 \text{ m}^3 \text{ air}}$$

$$20 \text{ g CO} \times 5 \text{ mi} = 0.087 \text{ m}^3 \text{ CO}$$

∴ at 9 ppm the following must hold:

$$\frac{9 \text{ m}^3 \text{ CO}}{10^6 \text{ m}^3 \text{ air}} = \frac{0.087 \text{ m}^3 \text{ CO}}{V \text{ m}^3 \text{ air}} \quad \text{solve for } V$$

$$V = 9666 \text{ m}^3$$

5 miles pollutes 9666 m<sup>3</sup> air

so one meter pollutes

$$\frac{9666 \text{ m}^3}{5 \text{ miles}} \cdot \frac{1 \text{ mile}}{1609 \text{ meters}} = \frac{1.2 \text{ m}^3}{\text{m}}$$

## CIVE 3331 Environmental Engineering

## Exercise\_002-7

- a) In Harris County, TX the median indoor airborne concentration of chloroform ( $\text{CHCl}_3$ ) was  $0.4 \mu\text{g}/\text{m}^3$ . Convert this concentration to a mole fraction in parts per billion assuming  $T=293\text{K}$  and  $P=1 \text{ atm}$ .
- b) The mean concentration of chloroform in drinking water in Harris County is  $42 \mu\text{g}/\text{L}$ . Convert this to a mass fraction in parts per billion (ppb).
- c) A typical adult inhales about  $20 \text{ m}^3$  of air and ingests about  $2 \text{ L}$  of water per day. Assuming that the concentrations determined above are appropriate, compare the exposure to chloroform via inhalation ( $\mu\text{g}$  per day) and ingestion ( $\mu\text{g}$  per day).
- d) Assume tetrachloroethylene ( $\text{C}_2\text{Cl}_4$ ) has median concentrations of  $0.10 \mu\text{g}/\text{L}$  in water and  $2.1 \mu\text{g}/\text{m}^3$  in air. Repeat the exposure pathway analysis for this chemical.
- e) Comment on the relative significance of breathing and drinking exposure to these two chemicals.

$$a) V_{293\text{K}} = V_{273\text{K}} \left( \frac{273\text{K}}{293\text{K}} \right) = 24.04 \text{ L/mol} \quad (\text{Version of Boyle's law})$$

$$0.4 \cdot 10^{-6} \frac{\text{g CHCl}_3}{\text{m}^3} \cdot \frac{1 \text{ mol CHCl}_3}{118 \text{ g CHCl}_3} \cdot \frac{24.04 \text{ L air}}{\text{mol air}} \cdot \frac{1 \text{ m}^3}{1000 \text{ L air}} = 8.149 \cdot 10^{-10} \frac{\text{mol CHCl}_3}{\text{mol air}}$$

$$8.149 \cdot 10^{-10} \times 10^9 = 0.082 \text{ ppb CHCl}_3$$

$$42 \cdot 10^{-6} \frac{\text{g CHCl}_3}{\text{L H}_2\text{O}} \cdot \frac{1 \text{ L H}_2\text{O}}{1000 \text{ g}} = 42 \cdot 10^{-9} \frac{\text{g CHCl}_3}{\text{g H}_2\text{O}} \times 10^9 = 42 \text{ ppb CHCl}_3$$

$$20 \text{ m}^3 \text{ air} \times 0.4 \mu\text{g}/\text{m}^3 = 80 \mu\text{g}/\text{day} \text{ inhale CHCl}_3$$

$$2 \text{ L H}_2\text{O} \times 42 \mu\text{g}/\text{L} = 84 \mu\text{g}/\text{day} \text{ ingest CHCl}_3$$

$$20 \text{ m}^3 \text{ air} \times 2.1 \mu\text{g}/\text{m}^3 = 42 \mu\text{g}/\text{day} \text{ inhale TCE}$$

$$2 \text{ L H}_2\text{O} \times 0.1 \mu\text{g}/\text{L} = 0.2 \mu\text{g}/\text{day} \text{ ingest TCE}$$

relative exposure  $\text{CHCl}_3$  is  $10\times$  greater via ingestion  
 relative exposure TCE is  $400\times$  greater via inhalation  
 if health effects (per chemical) are same by  
 either route then greater risk by ingestion for  $\text{CHCl}_3$ ,  
 and greater risk by inhalation for TCE
